

1. Relative-lattice mode

elementary joint eigenmode of
the two commuting translations

2. J0 momentum support

$$\widehat{B}_{J0}(\mathbf{k}) = \sum_m c_m \delta(\mathbf{k} - \mathbf{k}_m)$$

more centers $\Rightarrow$ more elementary
momentum channels

————— change support —————

3. Fixed-center jet multipoles

support fixed at $\mathbf{k}_0$

$$\mathbf{d}^\alpha e^{i\mathbf{k}_0^T \mathbf{d}} \longleftrightarrow i^{|\alpha|} \partial_{\mathbf{k}}^\alpha \delta_{\mathbf{k}_0}$$

same support, higher local
momentum moments

————— change thickness —————

4. Finite-window ambiguity

$$\frac{\sin(\varepsilon s)}{\varepsilon} = s + O(\varepsilon^2 L^3), \quad |s| \leq L$$

a J0 cluster and a jet can be hard
to distinguish when $\varepsilon L \ll 1$
